

Alesco – 500

The **Alesco – 500** is an induction heater. This implies that it creates a magnetic field, which in turn generates heat in the material.

By supplying the heat without a flame or heated tools, you can apply heat next to thermally sensitive material or merely heat a section without heating other adjacent material. All metal parts can be safely, easily and accurately heated with the Alesco-500. Heat is generated through rust, paintwork and plastic.

The **Alesco-500** is suitable for heating nuts, bolts on suspension and steering as well as hinges and cotters in all types of vehicles.

The **Alesco-500** can be used anywhere a gas flame is used for heating metal. It works on all types of metal even aluminium and copper. Alesco induction heaters are used in garages and workshops worldwide. Please contact Alesco directly for additional information and pricing.

The **Alesco-500** is equipped with a 20 litres water tank. The water circulates through the unit and hose package to keep it cool. With a full water tank the **Alesco – 500** will run for approximately 10 minutes with intermittence of 50% before the water has to be changed or left to cool down. To change the water you simply open the tap under the unit and then refill it at the front.

The picture shows an Alesco-500 which is a 4Kw heater. The Alesco-500 has been designed for everyday use in workshop and garage environment. The Alesco-500 is connected to an ordinary 400v/16A outlet
